What is Parkinson's disease?

Parkinson's disease (PD) is a progressive neurological condition. It is predominantly seen in the older population but 1 in 20 people newly diagnosed each year are aged under 40.

The cause is unknown, but what we do know that happens in the body is the degeneration of the dopamine producing cells in a specific part of the brain (substantia nigra). The loss of nerve cells in the brain causes the symptoms of Parkinson's to appear.

At present there is no known cure for Parkinson's disease. However, steady scientific advances are increasing the understanding of the condition, its cause and how best to treat individuals to reduce the symptoms.

Typical symptoms

Tremor which is more noticeable when you are resting. Rigid or stiff muscles and slowness of movements making it harder to do everyday activities.

Treatments

Medications can substantially improve the symptoms and therefore quality of life.

Parkinson's is a very individual condition in terms of which medications to use and at what time they are taken.

Treatment is usually life-long with adjustments and reviews being necessary as symptoms change and the condition progresses. Other treatments include physiotherapy, speech and language, and occupational therapy.

What is the hospital based Parkinson's Disease Nurse Specialist Service?

The Parkinson's disease nurse specialist (PDNS) service offers outpatient nurse led face to face clinics, Telephone clinics and a telephone advice line as well as support for patients in hospital.

The PDNS's is based in the acute trust and works closely with the neurology and elderly care consultants based at the Lister, New QEII and Hertford County Hospitals.

The PDNS's aims to enhance the quality of life and experience for people with Parkinson's, their carers, family and other healthcare professionals by sharing information and providing support.

The aim is also to increase awareness of the specific needs of people with Parkinson's when in hospital by acting as a resource of information, supporting medicines management and providing ongoing education and where a need is identified.

The PDNS can act as a link between hospital services, therapists, GPs and services in the community.

Things to do if being admitted into hospital

If your admission to hospital is planned then please let the PDNS service know as this will enable staff to prepare for your admission.

It is important that you bring in your medications in labelled packaging to support effective medication administration while you are in hospital.

Please bring with you a copy of your repeat prescription, including times of administration.

What you should expect when admitted into hospital

Please do request self-administration of your medications as an inpatient. Every effort will be made to facilitate this if safe to do so.

You should expect to get your medications at the time they are prescribed.

During your hospital stay, the PDNS service, Parkinson's consultant and ward based pharmacist will oversee the management of your medications.

You should expect to see the PDNS and/or your Parkinson's consultant within 48 hours of a referral being made, (excluding weekends and bank holiday periods).
